**Abstract:** The recent Human Development Report, “Uncertain Times, Unsettled Lives: Shaping our Future in a Transforming World”, by UNDP, argues that layers of uncertainty are stacking up and interacting to unsettle life in unprecedented ways. The last two years of the pandemic along with the Ukraine war have caused drastic socio-economic changes and influenced many lives across nations. This is very much evident in the recent Human Development Index calculated by UNDP wherein the levels are the same as were in 2016. This is a huge setback to the Sustainable Development Goals and a cause for serious concern across nations. Education promotes peace. Education has been touted as one of the most powerful tools we can implement in our global efforts to promote world peace. Confucius said it as far back as 500 B.C.: “Education breeds confidence. Confidence breeds hope. Hope breeds peace.” Education encourages independent thinking, and it opens doors to new ideas. Critical thinking coupled with independent thinking could lead to innovative solutions and alternatives to violence. Education Index published by United Nations Development Programme is considered with the Peace Index published by the Institute for Economics & Peace (IEP) which measures the relative position of nations' and regions' peacefulness. In this study, a single index value was computed using Multiplication probability and Max and Min methods by combining the education and peace index. It was found that there are countries whose education index is higher but whose peace index value is lower, with differences in ranking patterns. Therefore, by finding the single index value for education and peace, it is shown that education value is directly proportional to peace. The analysis helps design policies for reinstating human confidence in the system and living a peaceful coexistence with nature.

## 1. Introduction

### 1.1 Human Development Index

The Human Development Report published by UNDP, “Uncertain Times, Unsettled Lives: Shaping our Future in a Transforming World”, argues that layers of uncertainty are stacking up and interacting to unsettle life in unprecedented ways [1]. The last two years of the pandemic along with the Ukraine war have caused drastic socio-economic changes and influenced many lives across nations. This is very much evident in the recent Human Development Index calculated by UNDP wherein the levels were found to be the same as were in 2016 [2]. This is a huge setback to the Sustainable Development Goals and a cause for serious concern across nations. Education has been touted as one of the most powerful tools we can implement in our global efforts to promote world peace. Confucius said it as far back as 500 B.C.: “Education breeds confidence. Confidence breeds hope. Hope breeds peace.” Education encourages independent thinking, and it opens doors to new ideas. Critical thinking coupled with independent thinking could lead to innovative solutions and alternatives to violence.

### 1.2 Education index

The Human Rights Conventions declare: “Education must prepare a child for responsible life and effective participation in a free society in a spirit of understanding, peace, tolerance, equality of sexes and friendships among all peoples, ethnic, national and religious groups and persons of indigenous origin.” Education is a major component of well-being and is used in the measure of economic development and quality of life, which is a key factor determining whether a country is a developed, developing, or underdeveloped country. Education Index published by United Nations Development Programme is considered with the Peace Index published by the Institute for Economics & Peace (IEP) which measures the relative position of nations' and regions' peacefulness. The education index is an average of mean years of schooling (of adults) [3] and expected years of schooling (of children) [3], both expressed as an index obtained by scaling with the corresponding maxima.

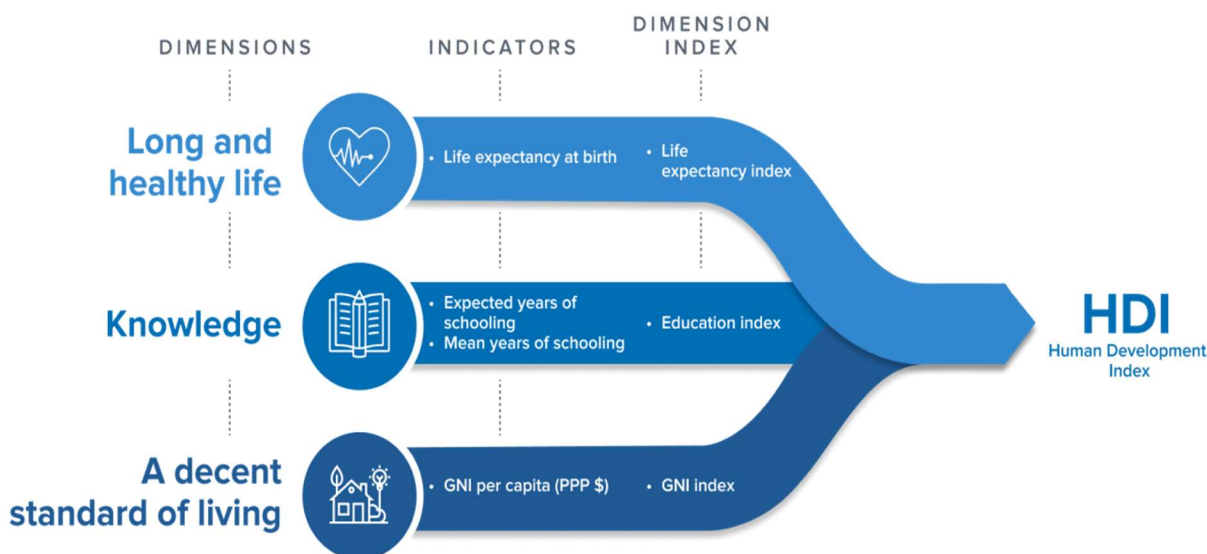

Fig 1: Human Development Index (source:<https://hdr.undp.org/data-center/human-development-index#/indicies/HDI>)

### 1.3 Calculation of Education Index

A country's education index is calculated with the following formula [4].

$$EI = (EYS/18 + MYS/15) / 2 \rightarrow 1$$

EYS expected years of schooling, is a calculation of the number of years a student is expected to attend school or university. In most countries, a master's degree represents the highest obtainable level of education, and obtaining one reflects 18 years of education [5]. This means that if every student in a country is enrolled in a master's degree that country's EYS index would be 1.0.

MYS, mean years of schooling, is a calculation of the average number of years of education a student over the age of 25 has received. It's based on the education attainment levels of the population converted into years of schooling based on the theoretical duration of each level of education attended [6]. 15 years is the projected maximum of this indicator for 2025 and is thus used as the maximum for the index. This means that a country whose citizens all attained 15 years of education by the age of 25, would have an MYS index of 1.0.

Worldwide education indexes are provided by the UNDP's Human Development Report derived from the UNESCO Institute for Statistics and other sources. [7]

### 1.3 Data Collection of Education Index

Data is collected from the Human Development Report of 135 countries from the year 1990 to 2019. Data of the Education Index of each year lies between 0 to 1 which indicates that as the probability value increases the education value increases.

The ranking on Education Index is shown in Table 1 (appendix).

### 1.4 Peace Index

Global Peace Index (GPI) is a report produced by the Institute for Economics & Peace (IEP) which measures the relative position of nations' and regions' peacefulness. The GPI ranks 135 countries (collectively accounting for 95 percent of the world's population) according to their levels of peacefulness. It has also empirically developed the Positive Peace Index (PPI), which measures the attitudes, institutions and structures that create and sustain peaceful societies.[8]

The eight pillars of positive peace are well-functioning government, sound business environment, acceptance of the rights of others, good relations with neighbours, free flow of information, high levels of human capital, low levels of corruption, and equitable distribution of resources.

A composite index measuring the peacefulness of countries made up of 23 quantitative and qualitative indicators each weighted on a scale of 1-5. The lower the score the more peaceful the country. These 23 Indicators which are used to rank the countries are shown in Table 2. Ranked on a 1 to 5 scale, were converted by using the following formula:

$$x = [x - \min(x)] / [\max(x) - \min(x)] \rightarrow 2$$

where  $\max(x)$  and  $\min(x)$  are the highest and lowest values for that indicator of the countries ranked in the index.

Table 2. Indicators of GPI ranks of countries [8]

	<b>Indicator</b>
1	Number and duration of internal conflict
2	Number of deaths from external organized conflict
3	Number of deaths from internal organized conflict
4	Number, duration, and role in external conflicts
5	Intensity of organized internal conflict
6	Relations with neighbouring countries
7	Level of perceived criminality in society
8	Number of refugees and displaced persons as a percentage of the population
9	Political instability
10	Impact of terrorism
11	Political terror
12	Number of homicides per 100,000 people
13	Level of violent crime
14	Likelihood of violent demonstrations
15	Number of jailed persons per 100,000 people
16	Number of internal security officers and police per 100,000 people
17	Military expenditure as a percentage of GDP
18	Number of armed-services personnel per 100,000
19	Volume of transfers of major conventional weapons as recipient (imports) per 100,000 people
20	The volume of transfers of major conventional weapons as a supplier (exports) per 100,000 people
21	Financial Contributions to UN peacekeeping missions
22	Nuclear and heavy weapons capability
23	Ease of access to small arms and light weapons

### 1.5 Data collection of Peace Index

Data is collected from the Global Peace Index Report of 135 countries from 2008 to 2019 [9]. Data is indicated on a scale of 1 to 5, which shows that the higher the values, the lesser the peace.

The values from a scale of 1 to 5 are required to be converted to a scale of 0 to 1 to be equivalent to the education index as it is required to study the relationship between education and peace [10].

The formula to convert the scale 1 to 5 as 0 to 1 is as follows:

$$X=1-(x_i/\text{Max}(X))\text{----}\rightarrow 3$$

X is a set of elements of the column such as (x1,x2,x3,.....)

The ranking on Peace Index is shown in Table 1.

### 1.6 Working procedure

Education index in the range of 0 to 1. Rank the countries in the descending order. It is represented as P(A).

Peace index in the range of 0 to 1. Rank the countries in the descending order. It is represented as P(B).

Since Education Index and Peace index are independent events, a single value index could be calculated as P(A)\*P(B) as multiplication probability.

Find the correlation between the Education Index, Peace Index, and Single Index Value of Multiplication Probability.

The latitude and longitude of countries are plotted using the folium package of python [11].

Another method to calculate a single value index is-

Find the maximum and minimum of the education index which is represented as max(e) and min(e)

Find the maximum and minimum of the peace index which is represented as max(p) and min(p)

The single index value is calculated as

$$X(e)-\text{min}(e)/(\text{max}(e)-\text{min}(e))*X(p)-\text{min}(p)/(\text{max}(p)-\text{min}(p))\text{----}\rightarrow 4$$

Where X(e) is the set of values of the education index and X(p) is the set of values of the peace index.

Find the correlation between the Education Index, Peace Index, and Single Index Value of the Maximum and Minimum methods.

The ranking of the Education index, Peace Index, Ranking of Multiplication Probability, and Max and Min Methods showed in Table 1.

## 1.7 Result and Analysis

### *Education Index*

The ranking of countries on the education index is shown in table 1. Countries plotted in the map using table 3 with the following range:

Table 3. Range based on the education index

Range	Number of countries	Colour
0-0.5	44	Red
0.5001-0.75	63	Orange
0.7501-0.8	11	Blue
>0.8	17	Green

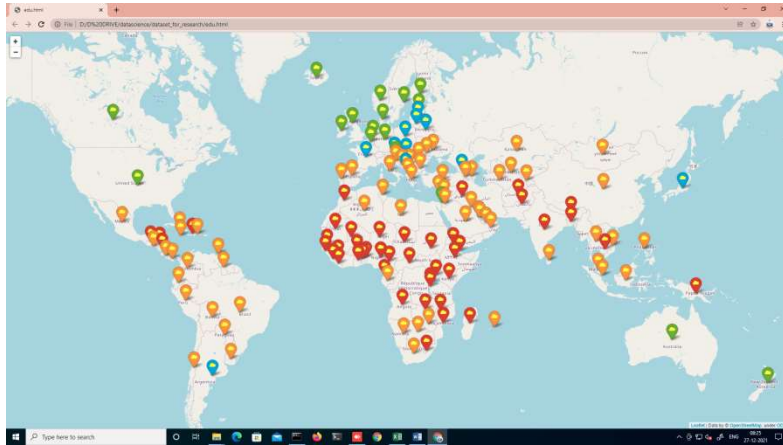

Fig. 2. Education Index values of different countries

Ranking of countries on Peace index is shown in the table 2. Countries plotted in the map using the table 4 with the following range.

Table 4. The above-mentioned countries in the table 1 are plotted in the map using the following range for the Peace Index.

Range	Number of countries	Colour
0-0.3	14	Red
0.300001-0.500000	84	Orange
0.500001-0.600000	27	Blue
>0.600001	10	Green

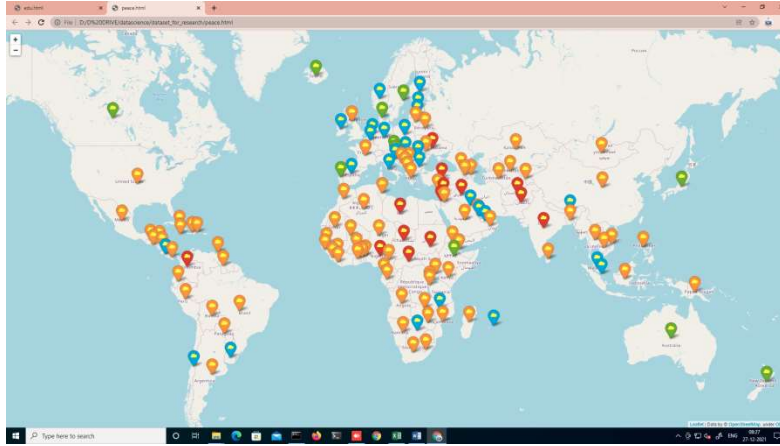

Fig. 3. Peace Index values of different countries

### 3.1 Single Index Value for Education and Peace using Multiplication probability

Ranking of countries on Peace and education index using Multiplication probability is shown in table 1.

#### 3.1.1 Correlation Analysis

The correlation between Education, Peace and the single index value of multiplication probability is shown in Table 5.

Table 5: Correlation between Education & Peace Index

	Education	Peace	Single Index Value of Multiplication Probability
Education	1	0.533278	0.875473
Peace	0.533278	1	0.84597
Single Index Value of Multiplication Probability	0.875473	0.84597	1

It could be concluded that by converting the education and peace index as a single index value education and peace are highly positively correlated with the Single Index Value of Multiplication Probability.

The above-mentioned countries are plotted on the map using the following range for the Single index value of multiplication probability shown in Table 6.

Table 6. Range of single index value of multiplication probability

Range	Number of countries	Colour
0-0.3	89	Red
0.300001-0.500000	38	Orange
0.500001-0.600000	6	Blue
>0.600001	2	Green

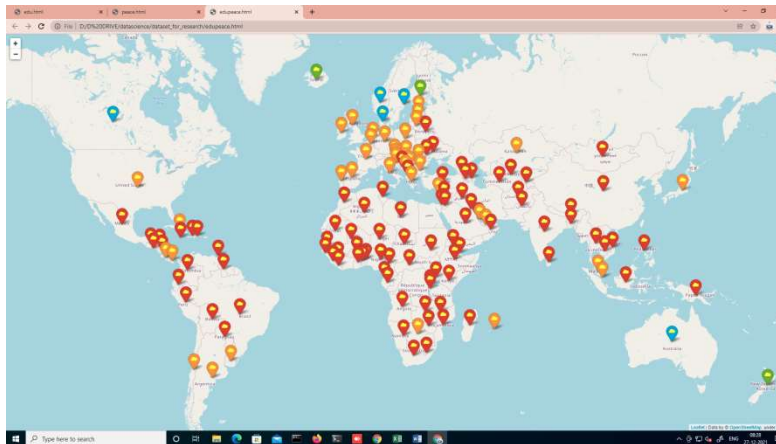

Fig 4. Plotting of Range for Single index value of multiplication probability

### 3.2 Single index value using Max and Min Method

Ranking of countries on Peace and education index using Max and Min method is shown in table 2.

#### 3.2.1 Correlation Analysis

The correlation between Education, Peace and the single index value of Max and Min method probability is shown in Table 1.

Table 7. The table shows the correlation of single index values using the Max and Min method

	Education	Peace	Single index value of using Max and Min method
Education	1	0.533278	0.887106
Peace	0.533278	1	0.816104
single index value using Max and Min method	0.887106	0.816104	1

It could be concluded that by converting the education and peace index as a single index value education and peace are highly positively correlated with Education & Peace. Therefore, based on the above conclusion, Table 8 is shown:

Table 8. The above-mentioned countries are plotted in the map using the following range for single index value using Max and Min method

Range	Number of countries	Colour
0-0.3	57	Red
0.300001-0.600000	56	Orange
0.600001-0.800000	15	Blue

>0.800001	7	Green
-----------	---	-------

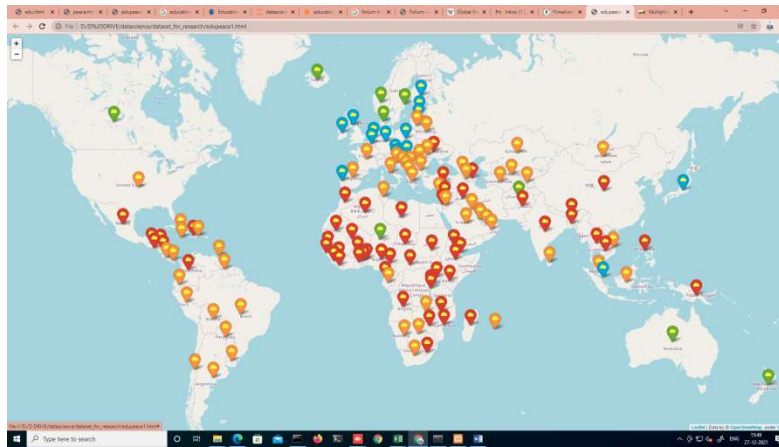

Fig 5. Plotting of range for single index value using Max and Min method

#### 4. Comparison of the two methods

The correlation between the single index value of multiplication probability and the single index value of the max and min method is 0.998239.

Table 9. The range between the single index value of multiplication probability and the single index value of the max and min method.

Multiplication Probability		Max and Min Method	
Range	Number of countries	Range	Number of countries
0-0.3	89	0-0.3	57
0.300001-0.500000	38	0.300001-0.600000	56
0.500001-0.600000	6	0.600001-0.800000	15
>0.600001	2	>0.800001	7

R<sup>2</sup> score is 0.70013 and the Correlation is 0.8608 between the two methods.

A Bland-Altman plot [12] is used to visualize the differences in measurements between the two methods and their values are shown in table 10. A Bland–Altman plot (difference plot) in analytical chemistry or biomedicine is a method of data plotting used in analyzing the agreement between two different assays. [13,14]

Table 10. The Bland-Altman value between the two methods.

Mean of method 1	33.75
------------------	-------

Mean of method 2	33.75
N	4
DoF	3
Mean Diff (Bias)	0
SD Diff	19.065
Lower LoA	-37.368725
Upper LoA	37.368725
Within Subject SD	13.481469
Repeatability Coefficient	37.368725

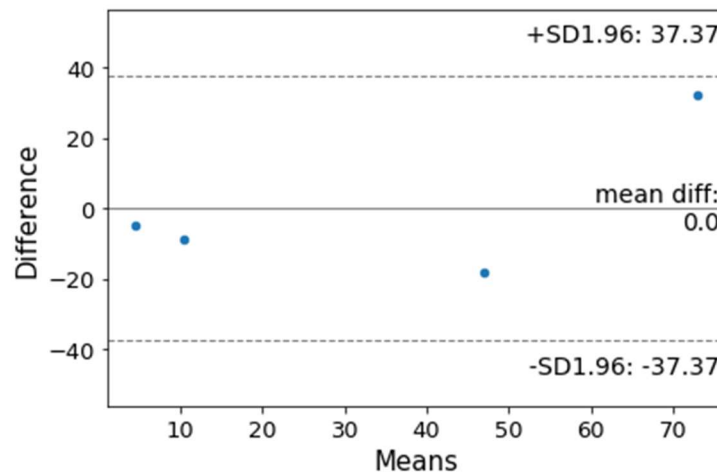

Fig 6. Mean difference of countries in Bland Altman plot.

The average difference turns out to be 0 and the 95% confidence interval for the average difference is [-37.37, 37.37].

The data is normally distributed since all the points lie within two standard deviations of the mean and the repeatability coefficient is 37.368725 which is the precision measure.

Since the average difference is 0 there is no significant difference between the two methods. Therefore, either of the methods could be used for calculating multiplication probability.

## 5. Discussion

Education is a significant contributor to peace and appears in two of the 24 indicators in the Positive Peace Index produced by the Institute for Economics and Peace.

Education can lead to peace and help build peaceful communities and thereby peaceful nations [15]. Education in many ways is a fundamental building block through which societies can build resilience and develop mechanisms to learn and adapt. Mean years of schooling are closely associated with the most peaceful countries

[9]. The focus on how peace leads to better education is evidenced in post-war countries and therefore both are inseparable. The suggested method of Single index value is for categorizing countries to consider the indicators for ranking of countries and a significant difference in ranking is observed for both indices as it is given by different agencies. In this study, the ranking of the countries varied with the use of Multiplication probability for a single value. The findings of this study reflect that by using a single method to combine both the education index and peace index the country's rankings can provide useful insights into the correlation between both indices. Therefore, by finding the single index value for education and peace it is shown that education value is directly proportional to peace.

## 6. Conclusion

The single index value of multiplication probability and the Single index value of Max and Min shows that the two methods are efficient and precise. Even though there are countries where the education index is good, peace is low. It is being plotted on the map for better visualization and information.

As educational values were given more importance in the countries such as New Zealand, Iceland, Denmark, Australia, Canada, Norway, Sweden, Finland, and so on, internal, and external conflicts are very less and found peacefulness in the country.[9]

There are countries such as Israel and the United States where education is best, but the peace index is low because of external/internal conflicts. This is suggestive that countries should focus on increasing their peace index value in correlation to their education index for better ranking in both. These countries should focus on educational values in order to increase the peace index.

The study on education and peace index as a single index value provides information that education is proportional to peace, and it is important to increase the education index for ensuring peace.
